

## What is a Theme?

Fundamentally, the WordPress Theme system is a way to "skin" your weblog. Yet, it is more than just a "skin." Skinning your site implies that only the design is changed. WordPress Themes can provide much more control over the look and presentation of the material on your website.

--	--	---

A WordPress Theme is a collection of files that work together to produce a graphical interface with an underlying unifying design for the site. These files are called template files. A theme modifies the way the site is displayed, without modifying the underlying software. Themes may include customized template files, image files (\*.jpg, \*.gif), style sheets (\*.css), custom Pages, as well as any necessary code files (\*.php). For an introduction to template files, see [Stepping Into Templates](#).

## Using Themes

### Selecting the Active Theme

To select the active theme for your site:

1. Log in to the WordPress Administration Panels.
2. Select the **Design** subpanel.
3. From the **Available Themes** section click on theme title (or theme screenshot) for the theme you wish to activate.

4. After you select your theme, a window will open with a preview of your site with the chosen theme. Click on the '**Activate (theme name)**' to activate that theme (located in the upper right corner). Or Click on the '**x**', in the upper left corner to cancel your theme choice.
5. To view the new look, click **View Site** at the top of the Panel's screen.

Your selection should immediately become active.
